CyberHoot Adds Phish Testing Module

FOR IMMEDIATE RELEASE

Portsmouth, NH - July 2020 – CyberHoot has made phish testing a core component of CyberHoot. This module is now available to all clients and resellers. CyberHoot is joining the fight against increased hacker phishing and ransomware attacks with a strong employee testing service. Phishing campaigns test employees with realistic emails mimicking current event topics, just like hackers do. CyberHoot contains fake phishing campaigns on COVID-19, John’s Hopkins, Amazon, Google, Microsoft, and even SBA Loans. Employees need to be on their toes to avoid clicking on our phishing tests. However, it is far better to learn from a test than fail a real-world attack!

Call to Action:

All you need to do is sign up at CyberHoot. Phish testing is delivered directly to your employees’ inboxes. Select a campaign, choose your target users, run a quick test of your Allow Lists (to ensure emails get delivered to users’ inboxes), and then schedule the campaign. CyberHoot’s Phishing module automates everything else, allowing you to assign extra micro-trainings on spotting and avoiding phishing emails to users who clicked links or entered credentials into our fake websites.

Become More Aware. Become More Secure.

What our Customers are telling us?

“I cannot stress enough how comforting it is to see an employee forward me a phishing attack email noting he/she didn’t click but wanted me to know it was caught and destroyed.”

– Bill Hurley, Owner – Infinite Imaging –
